

ECP-2008-EDU-428037

Fully integrated experiments and virtual laboratories

Deliverable	<i>D4.2</i>
Dissemination level	<i>Public</i>
Delivery date	<i>2 December 2011</i>
Status	<i>Final</i>
Author(s)	<i>H. Scheel, C. Thomsen, T. Robbe</i>

eContentplus

This project is funded under the *eContentplus* programme¹,
a multiannual Community programme to make digital content in Europe more accessible, usable and
exploitable.

4.1. External Content	16

1. Introduction

Library of Labs (LiLa) is a project of eight European universities and three enterprises co-funded by the EU programme eContentplus. During the project duration, LiLa has implemented a portal that integrates remote and virtual laboratories and experiments. For the success of the LiLa portal it is evident that the content is present in the portal, can be easily found by students and teachers and can be easily used in the portal or applied to the learning management system (LMS) of the teacher's school or university. This task, the integration of content, as it is closely connected to the success of the project, is anchored in work package 4. Nevertheless, the integration of content depends heavily on a number of portal functionalities, as for example the search engine or the booking system.

2. D4.2 - Outcome

The deliverable **D4.2** has been fully delivered, with a delay of six month. An additional 37% of content (220 items instead of 160) was integrated into the portal by the consortium. Due to the diversity of the underlying content, the deliverable could have been delivered on time with cuts, as described in **Section 3.1** and in the progress reports, namely progress report no. 5. Especially the single sign-on functionalities and the booking functionalities of the LiLa portal (delayed due to security reasons) were reckoned as being very important for the integration of content and therefore for the LiLa project as a whole.

3. Underlying Content

In the description of work (DoW) partners from the University of Stuttgart, the Berlin Institute of Technology, the University of Cambridge, Computational Modelling Cambridge Ltd., the Aristotle University of Thessaloniki, the University of Basel and the Linkoeping University agreed to submit content, as summarized in section “4.1 Underlying Content” of the DoW. In **Table 1** we present an updated list of the content actually integrated into the LiLa portal. Most of the underlying content had been submitted as LiLa Learning Objects (LLOs) when the deliverable D4.2, “Fully integrated experiments and virtual laboratories M21”, was due (see also previous progress reports). The remote experiments from Berlin, for example, were already prepared as SCORM compliant LLOs in December 2009 and submitted to the internal repository. At that time, however, the LiLa booking system and the single sign-on functionalities still needed to be developed. In the next sub-section we will give a more detailed view on the difficulties encountered during the integration of content. All remote experiments, virtual experiments and the additional content in the portal are now annotated with applicable metadata.

Table 1: Content published by LiLa partners on the LiLa Portal (www.library-of-labs.org).

3.1. Integration Process

The integration of content depends strongly on the functionalities of the developing portal including security issues on the content providing side which needed to be considered. For different reasons some content could not be fully integrated as scheduled (M21 or M24 of the extended period). Amongst others the following problems caused delays:

1. The very strict network security policy of the University of Cambridge (see WP 4 section of progress report no. 5).
2. The Remote – Atomic Force Microscope, which is a very expensive and sensitive setup, needed to be reprogrammed with additional security features, preventing the user from destroying the atomic-sharp cantilever-tips.
3. The single sign-on functionality in connection with the booking-system used in all Remote Experiments from Berlin, developed by WP2, raised possible security issues on the Berlin experiment side. These problems could be solved during and in the period after the Lila-conference in Cambridge in April 2011. The solution had to be implemented mainly after the termination of the “Online Practical Course with Remote Experiments” in September 2011. During the last project meeting in Stuttgart (24.-25- October 2011) some minor bugs connected to the single sign-on and the booking system could be resolved. All LLOs had to be re-packaged and uploaded to the portal.
4. Much time had to be spent on the re-integration and checking of media, because major crashes of the LiLa portal during development caused loss and corruption of data.

4. Additional Content

During the term of the LiLa project content has been made available by the LiLa consortium in addition to that mapped in the Description of Work. This additional content is listed in **Table 2** carrying on the numbering from **Table 1** (221 through 322).

Table 2: Additional content integrated into the LiLa portal.

4.1. External Content

Even though the LiLa-portal was still in development during most of the run of the project, some external partners joined the project by giving their content for free. The Lila-Learning-Objects (LLOs) were then prepared within the LiLa-consortium and are now available for use in the portal or as download. This process was very helpful for the evolution of the LiLa project, as the diversity of the content grew. This should make it easier for future content providers to integrate their content into the Library of Labs.

The **PhET project at the University of Colorado** (<http://phet.colorado.edu/>) provides serious games, interactive, research-based simulations of physical phenomena. The Library of Labs hosts at the moment 67 examples from the fields electricity, energy, light, math, motion quantum physics, thermodynamics and waves.

The interactive geometry software “**Cinderella**” (<http://www.cinderella.de/>) contributes 21 applets covering subjects in physics.

The University of Technology in Sydney contributed six prototypical examples of their large **LabShare** rig collection (<http://www.labshare.edu.au/>), which are currently offline for technical reasons and therefore not listed.

During the project duration several requests to join the LiLa project have been handed in. One example that reached the partners in Berlin came from the Indian Institute of Technology in Kharagpur, offering to integrate their Remote-Experiments in the field of electronics (rectifiers, operational amplifiers). Consequently, the integration of content will continue after the end of community funding.
